 CN 2-Thiophenecarboxylic acid, 3-(4-chlorophenyl)-4-cyano-5-(cyclohexylthio)-
 (CA INDEX NAME)

AB Screening of the ICSN chemical library led to the discovery of 3-(4-chlorophenyl)-4-cyano-5-thioalkylthiophene 2-carboxylic acids as potent farnesyltransferase inhibitors. Enzymic kinetic studies showed that this original FTI series belongs to the CaaX competitive inhibitor class. Preliminary SAR studies allowed us to improve the IC50 from 110 to 7.5 nM.

CN 2-Thiophenecarboxylic acid, 4-cyano-3-[4-(1,1-dimethylethyl)phenyl]-5-(phenylthio)-, ethyl ester (CA INDEX NAME)

AB The synthesis and initial SAR studies of novel, highly potent pos. allosteric modulators of AMPA receptors based on 3-(4-tert-butylphenyl)-4-cyano-5-methylsulfanyltiophene-2-carboxylic acid are described. SAR studies at the thioether moiety indicated that substitution at this position was mandatory and better potency was achieved with small groups.

IT 858280-91-8
RL: BSU (Biological study, unclassified); PRP (Properties); BIOL (Biological study)
(small mol. enhancement of HLA-DM catalysis of HLA-DR/peptide exchange)

RN 858280-91-8 CAPLUS

CN 2-Thiophenecarboxylic acid, 3-(4-chlorophenyl)-4-cyano-5-(cyclohexylthio)-
(CA INDEX NAME)

AB HLA-DM plays a critical role in Ag presentation to CD4 T cells by catalyzing the exchange of peptides bound to MHC class II mols. Large lateral surfaces involved in the DM:HLA-DR interaction have been defined, but the mechanism of catalysis is not understood. In this study, the authors describe four small mols. that accelerate DM-catalyzed peptide exchange. Mechanistic studies demonstrate that these small mols. substantially enhance the catalytic efficiency of DM, indicating that they make the transition state of the DM:DR/peptide complex energetically more favorable. These compds. fall into two functional classes: two compds. are active only in the presence of DM, and binding data for one show a direct interaction with DM. The remaining two compds. have partial activity in the absence of DM, suggesting that they may act at the interface between DM and DR/peptide. A hydrophobic ridge in the DMβ1 domain was implicated in the catalysis of peptide exchange because the activity of three of these enhancers was substantially reduced by point mutations in this area.
